

## CMMS Software from NDC-BPO

CMMS software provides end-to-end solution within an integrated Asset Management frame work. Our computerized maintenance software solutions were developed from the reality that maintenance processes and Inventory management are directly linked to the revenue producing assets at work in manufacturing organizations. The encompassing services provided by NDC-BPO's CMMS make this possible.

Robust CMMS Software Solutions and Practical Business consulting that deliver business-critical information.

Our CMMS software solutions are aimed at providing the services and tools required to enable well informed decision making from the Shop Floor to the Top Floor of every organization we serve. All shop floor operations are intertwined with the critical strategic and tactical business decisions being made on the top floor of every organization. Maintenance optimization through deployment of a CMMS solution plays a strategic role in every business, but by itself, does not justify the actions needed to continuously strive to optimize asset life and productivity.

NDC-BPO's CMMS solutions include: maintenance optimization, enterprise asset management, and integration with strategic business systems and alliance partners. All these are coordinated to dynamically deliver the information and knowledge required by our customers to operate their businesses most efficiently and effectively.

We have developed a unique set of resources in order to execute our Shop Floor to Top Floor strategy. At the core of our solution is the CMMS application which serves as the organization's primary asset management toolkit and information repository. Fully integrated into CMMS are maintenance planning, work flow management, Inventory and purchasing.

Beyond the CMMS application, our professional services provide the tools and capabilities needed to integrate business processes across diverse corporate applications, geographies, and topologies. We allow businesses to access information from multiple, disparate systems. This creates interoperability between your major Finance, Production and Plant Floor systems, and provides seamless information sharing and collaboration between all departments. This makes information available to users through system-level interfaces, thereby allowing organizations to build new and dynamic sources of information and knowledge to meet their constantly changing needs.
